Building Software Applications with

JMatter

Eitan Suez

The JMatter framework (see http://jmatter.org/) is a modern, model-driven framework for constructing business applications. It leverages Swing, Hibernate, and Java WebStart. JMatter frees developers to work on their applications' business logic without getting mired in persitence or GUI work. Today software projects spend a disproportionate fraction of their development resources building generic scaffolding for business applications: login screens, authentication, CRUD, persistence, system navigation, mechanisms for performing queries, wizards, calendaring, etc.. JMatter is an open-source project, available under either GPL license and alternatively under a commercial license. This project was open-sourced in June of 2006.

Quotes

If you've ever wanted to explore Naked Objects as a way of building cool, powerful business applications quickly — or if you've already tried Naked Objects but decided it wasn't ready yet — you owe it to yourself to give it a try.

-- Glenn Vanderburg

It was quite amazing. It reminded me of the first time I saw Dave Thomas give a Rails demo.

-- Jared Richardson

..so it's worth jumping over to his site to get a preview of the future.

-- Neal Ford

JMatter.org ROCKS!

-- Matt Payne
